

# GOOGLE HOME

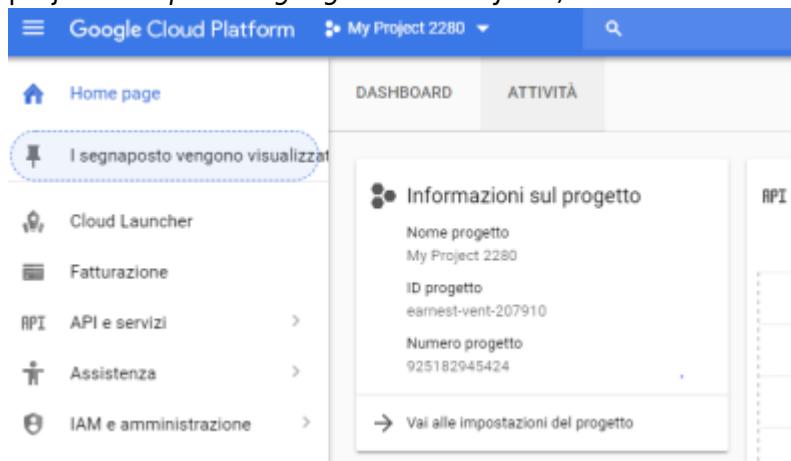

- Create a new project in the <https://console.cloud.google.com/home/dashboard> console
  - Specify project name and country

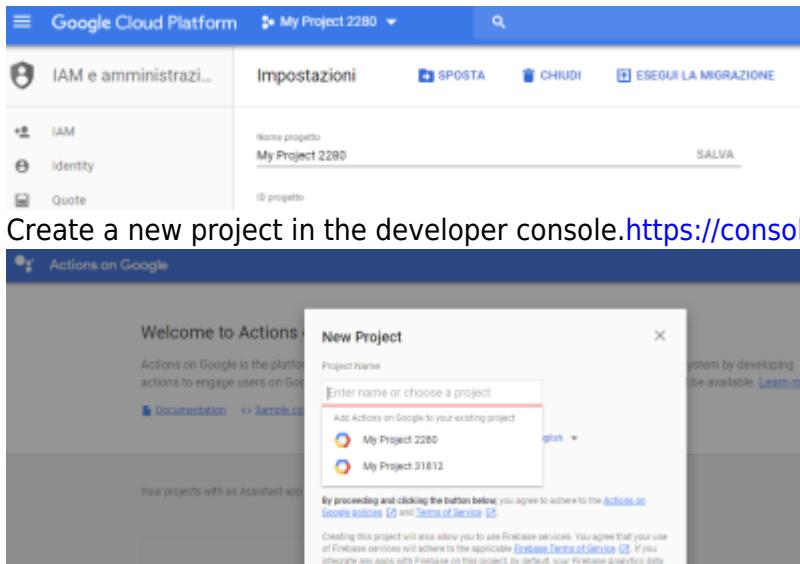

- Now you get a new project to the cloud console. Here you get a new project\_id.
- Enable HOMEGRAPH API to the new project.

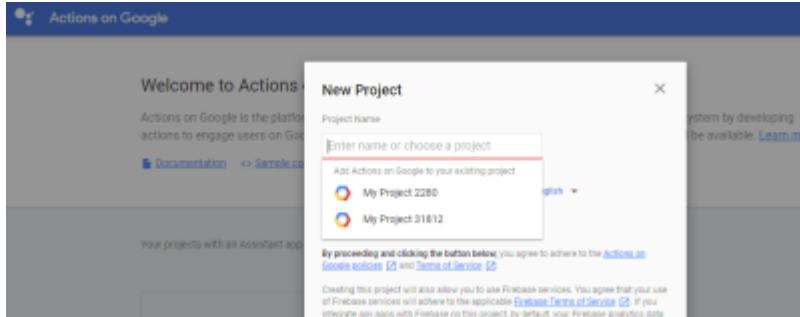

- Generate a new API key (the same Api key of `apikey` in `googleassistant.yaml`)
- IAM E amministrazione/impostazioni/ESEGUI LA MIGRAZIONE (By this, they share the same `projectid` request in `googleassistant.yaml`)

The screenshot shows the Google Cloud Platform's IAM & Administra... page. On the left, there's a sidebar with options: IAM e amministrazione, IAM, Identity, and Quota. The main area shows a project named 'My Project 2280' with a 'SALVA' (Save) button. The top navigation bar includes 'Google Cloud Platform', 'My Project 2280', and a search bar.

- Create a new project in the developer console. <https://console.actions.google.com>

The screenshot shows the 'Actions on Google' developer console. It's a 'New Project' dialog box. The 'Project name' field is empty. Below it, there's a dropdown menu with two options: 'My Project 2280' and 'My Project 31812'. The background shows the 'Welcome to Actions' page with some documentation links and a list of projects.

1. Add/Import project, give it a name (The same project created by the Google Cloud platform above)
2. Click on Home Control card, select the Smart home recommendation
3. Create an Action, under the build section. Add in your url: [https://\[YOUR HOME ASSISTANT URL:PORT\]](https://[YOUR HOME ASSISTANT URL:PORT]/api/googleassistant) with the domain / ip address and the port your Home Assistant is reachable. If you have set apipassword: add this password to the URL - eg [https://\[YOUR HOME ASSISTANT URL:PORT\]/api/googleassistant?apipassword=\[YOUR API PASSWORD\]](https://[YOUR HOME ASSISTANT URL:PORT]/api/googleassistant?apipassword=[YOUR API PASSWORD])
4. Click Done. Then click on Overview, which will lead you back to the app details screen.

◦ Account linking is required for your app to interact with Home Assistant. Set this up under the Quick Setup section  
- Leave it at the default No, I only want to allow account creation on my website and select Next

1. For the Linking type select OAuth and Implicit
2. Client ID: The clientid from your Home Assistant configuration above - Authorization URL (replace with your actual URL): [https://\[YOUR HOME ASSISTANT URL:PORT\]/api/googleassistant/auth](https://[YOUR HOME ASSISTANT URL:PORT]/api/googleassistant/auth). If you have set apipassword: add this password to the URL [https://\[YOUR HOME ASSISTANT URL:PORT\]/api/googleassistant/auth?apipassword=\[YOUR API PASSWORD\]](https://[YOUR HOME ASSISTANT URL:PORT]/api/googleassistant/auth?apipassword=[YOUR API PASSWORD])) - Configure your client. Add scopes for email and name. - Testing instructions: Enter anything. It doesn't matter since you won't submit this app.

\* Back on the overview page. Click Simulator under TEST - you don't have to actually test

\* If you haven't already added the component configuration to configuration.yaml and restarted Home Assistant, you'll be unable to continue until you have. ===== googleassistant.yaml =====

<code> googleassistant: projectid: someproject-2d0b8 clientid: [long URL safe random string] accesstoken: [a different long URL safe random string] agentuserid: [a string to identify user] apikey: [a Homegraph API Key generated for the Google Actions project] exposeddomains:

- switch
- light
- group entityconfig: switch.kitchen: name: Custom Name for Google Assistant aliases: -

*bright lights - entry lights light.livingroom: expose: false room: living room </code>*

- Reset Home Assistant and TEST ACTION

- Open the GOOGLE HOME APP and go into Settings > Home Control

- Click the + sign, and near the bottom, you should have [test] your app name. Selecting that should lead you the screen where you can set rooms for your devices or nicknames for your devices.

- If you want to allow other household users to control the devices:

1. GO to the settings for the project you created in point 1 in the developer console.

- Under the gear icon, click Permissions

2. Click Add, type the new user's e-mail address and choose Project → Editor role

3. Have the new user go to developer console and repeat steps starting from point 4

- Open the Google Assistant app and go into Settings > Home Control

- Click the + sign, and near the bottom, you should have [test] your app name. Selecting that should lead you the screen where you can set rooms for your devices or nicknames for your devices.
