

GOOGLE HOME

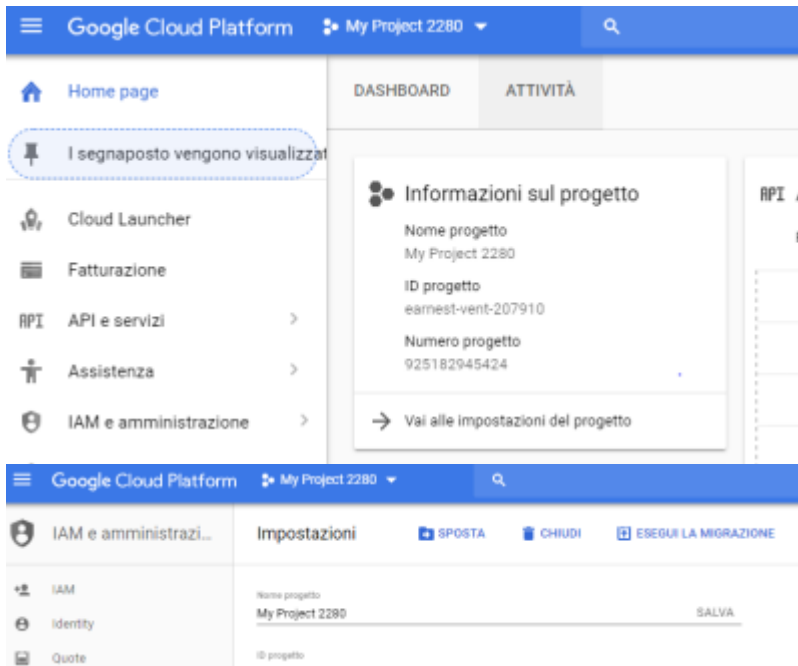

- Create a new project in the <https://console.cloud.google.com/home/dashboard> console
- Specify project name and country

- Now you get a new project to the cloud console. Here you get a new project_id.
- Enable HOMEGRAPH API to the new project.

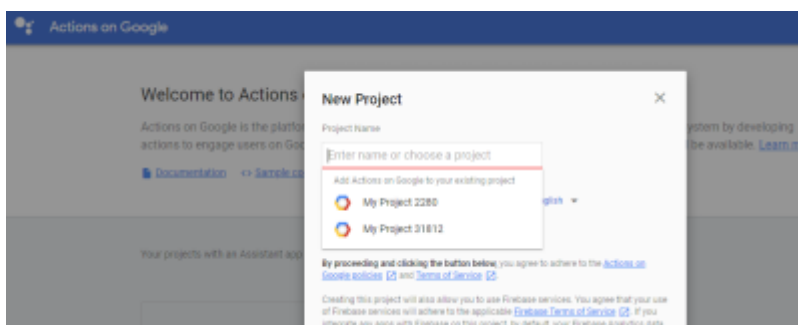

- Generate a new API key (the same Api key of api_key: in google_assistant.yaml)
- IAM E amministrazione/impostazioni/ESEGUI LA MIGRAZIONE (By this, they share the same project_id request in google_assistant.yaml)

- Create a new project in the developer console. <https://console.actions.google.com>

1. Add/Import project, give it a name (The same project created by the Google Cloud platform above)

1. Click on Home Control card, select the Smart home recommendation
2. Create an Action, under the build section. Add in your url: https://ha.csgalileo.org/ha-albertofiocco/api/google_assistant
3. Click Done. Then click on Overview, which will lead you back to the app details screen.

- Account linking is required for your app to interact with Home Assistant. Set this up under the Quick Setup section

1. Leave it at the default No, I only want to allow account creation on my website and select Next
2. For the Linking type select OAuth and Implicit
3. Client ID: The client_id from your Home Assistant configuration above
4. Authorization URL (replace with your actual URL): [https://\[YOUR HOME ASSISTANT URL:PORT\]/api/google_assistant/auth](https://[YOUR HOME ASSISTANT URL:PORT]/api/google_assistant/auth). If you have set api_password: add this password to the URL [https://\[YOUR HOME ASSISTANT URL:PORT\]/api/google_assistant/auth?api_password=\[YOUR API PASSWORD\]](https://[YOUR HOME ASSISTANT URL:PORT]/api/google_assistant/auth?api_password=[YOUR API PASSWORD])
5. Configure your client. Add scopes for email and name.
6. Testing instructions: Enter anything. It doesn't matter since you won't submit this app.

- Back on the overview page. Click Simulator under TEST - you don't have to actually test .

- If you haven't already added the component configuration to configuration.yaml and restarted

Home Assistant, you'll be unable to continue until you have.

google_assistant.yaml

```
google_assistant:
  project_id: someproject-2d0b8
  client_id: [long URL safe random string]
  access_token: [a different long URL safe random string]
  agent_user_id: [a string to identify user]
  api_key: [a Homegraph API Key generated for the Google Actions project]
  exposed_domains:
    - switch
    - light
    - group
  entity_config:
    switch.kitchen:
      name: Custom Name for Google Assistant
      aliases:
        - bright lights
        - entry lights
    light.living_room:
      expose: false
      room: living room
```

- Reset Home Assistant and TEST ACTION
- Open the GOOGLE HOME APP and go into Settings > Home Control
- Click the + sign, and near the bottom, you should have [test] your app name. Selecting that should lead you the screen where you can set rooms for your devices or nicknames for your devices.
- If you want to allow other household users to control the devices:
 1. GO to the settings for the project you created in point 1 in the developer console.
 2. UNDER the gear icon, click Permissions
 3. Click Add, type the new user's e-mail address and choose Project → Editor role
 4. Have the new user go to developer console and repeat steps starting from point 4
- Open the Google Assistant app and go into Settings > Home Control
- Click the + sign, and near the bottom, you should have [test] your app name. Selecting that should lead you the screen where you can set rooms for your devices or nicknames for your devices.
